(54) EXPOSURE DEVICE OF COPYING MACHINE

(57)Abstract:

PURPOSE: To keep always the illuminance distribution of a projected image on a photosensitive surface uniform by peeling properly parts of a coating layer corresponding to respective corner parts of a platen to increase the light going from corner parts of the platen toward the photosensitive surface.

CONSTITUTION: Both faces of a platen 3 are coated with reflection preventing films 8, and the front face is coated with a transparent conductive film 9 furthermore to form a coating layer, and parts of this coating layer corresponding to corner parts C of the platen 3 are peeled. Thus, the quantity of light irradiated from corner parts C of the platen 3 to the photosensitive surface is hardly smaller than that irradiated to corner parts C. Since the quantity of light reaching parts other than corner parts C is reduced uniformly by the reduction of the transmittance due to the coating layer, the quantity of light irradiated to the photosensitive surface from parts other than corner parts C of the platen 3 is slightly smaller than the quantity of light irradiated to these parts. As the result, the quantity of light

irradiated from corner parts C of the platen 3 and that from other parts are approximately equal to each other relatively, and a lack of illuminance on parts of the photosensitive surface corresponding to corner parts C is eliminated, and the copy quality is kept well.
